THE PROBLEM

Insurance contact centres are buried in routine calls.

Imagine you run the customer service team at a mid-size direct insurer. Every day, 2,400 calls come in. Nearly 70% are Tier-1: coverage questions, billing queries, opening hours. Each one costs EUR 2.40 and takes a trained agent 4–6 minutes. At the end of the day, nothing has been resolved that an AI couldn't have answered in 8 seconds.

Why it persists

- Hiring takes 6–8 weeks per agent
- Training for policy knowledge: months
- Demand peaks at claims — unpredictable
- Human agents: 70% of time on FAQs
- 24/7 coverage needs 3× headcount

68%

of contacts are
Tier-1 — routine

Industry avg (Gartner 2023)

EUR 2.40

cost per
human-handled call

42 agents × EUR 50k loaded

876k

contacts per year
at current volume

2,400/day × 365

THE SOLUTION

A multi-agent voice pipeline that resolves 68% of contacts without a human.

If unresolved after 2 turns → auto-escalate with handoff summary to human agent

Automation on every call:**n8n**

EU AI Act · Art. 52

GDPR · Audio not stored

Deployed on Render · EU

How Tina Speaks

Speech-to-text → intelligence → text-to-speech → face.

THE SOLUTION

Deepgram nova-3 · Speech-to-Text

What it does

Streams the customer's voice via WebSocket in real time, transcribing each word as it is spoken. The live transcript is what the 7-agent pipeline actually reads — Deepgram is the ears of the system.

Why nova-3

Best-in-class accuracy on accented English and German insurance vocabulary. Low-latency streaming (<300ms first token) keeps the 4.3s total response time achievable. Audio is discarded immediately after transcription — GDPR by design.

→ Live WebSocket STT · <300ms latency · audio not stored

ElevenLabs · Text-to-Speech

What it does

Converts Claude's text reply into natural-sounding speech in Tina's voice. The audio stream is fed directly to Simli to drive the lip-sync animation. ElevenLabs is the voice of the system.

Why ElevenLabs

Hyper-realistic voice quality that passes as human in blind tests. Custom voice cloning lets the insurer own Tina's persona. Streams audio chunks as they are generated — no waiting for the full reply before playback begins.

→ Streaming TTS · custom voice clone · feeds Simli lip-sync

Simli · Lip-sync Avatar

What it does

Takes the ElevenLabs audio stream and animates Tina's face in real time — mouth, jaw and micro-expressions sync to the spoken words. The customer sees and hears a person, not a chatbot.

Why it matters

Insurance is a high-stakes, trust-sensitive domain. A realistic avatar increases perceived empathy and completion rates vs a disembodied voice or chat bubble. Simli renders in browser — no app install, no plugin.

→ Real-time lip-sync · browser-native · no install required

THE SOLUTION

7-Agent Pipeline

Router + Claude 4.6

One question. Seven specialists. Every reply verified before it is spoken.

WHY 7 AGENTS? Each has one job and one failure mode. Routing is separated from retrieval from generation from compliance. Each can be tested, swapped or scaled independently. A monolithic prompt would make all of these inseparable — and unauditable.

THE SOLUTION

Dual RAG Architecture

Two retrieval layers working in parallel — every query hits both before Claude answers.

1 Knowledge Base

Keyword-matched FAQ layer — 87 curated Q&A pairs

What it is

A hand-crafted JSON store of 87 insurance FAQs covering coverage, billing, claims, and opening hours. Each entry has a question, a canonical answer, and keyword tags used for fast retrieval.

How it works

The KnowledgeBase agent runs a substring keyword match against the user query. Top-scoring entries are injected directly into Claude's context window as grounded facts. No embedding cost, zero latency overhead.

Why this design

Deterministic and auditable — every answer is traceable to a verified FAQ. Ideal for compliance-sensitive insurance responses where hallucination risk must be minimised.

→ Coverage questions · Billing FAQs · Opening hours · Claims

2 Policy RAG

Semantic vector search — 27 PDF chunks in pgvector

What it is

Real insurance policy PDFs chunked into 27 passages and stored as vector embeddings in Supabase pgvector. Handles policy-specific questions that no FAQ can pre-answer.

How it works

The PolicyRAG agent embeds the user query with the same model used at ingest, runs a cosine similarity search via Supabase `match_documents()`, and returns the top-3 most relevant chunks to Claude's context.

Why this design

Semantic search finds meaning, not just keywords. “Does Leitungswasser damage fall under my Hausrat cover?” cannot be keyword-matched — it must be retrieved from the exact policy clause.

→ Policy-specific clauses · Exclusions · Coverage limits · Legal

THE SOLUTION

Supabase as the Data Layer

One database, three jobs: power the RAG, know the customer, prove compliance.

Open-source Firebase
Postgres + pgvector + Auth

1 Vector Store

TABLE: policy_documents

Stores the 27 PDF chunks as high-dimensional vector embeddings. When a customer asks a policy question, InsurVoice queries this table via cosine similarity to find the most relevant policy passage.

Why it matters

No third-party vector DB needed. pgvector runs inside Postgres — same database, same connection, zero extra infrastructure. Every answer is grounded in the actual policy text, eliminating hallucination.
→ `match_documents()` · cosine similarity · top-3 chunks returned

WHY SUPABASE?

- gvector built-in** — vectors, CRM and logs in one Postgres instance, one connection string
- EU-hosted** — data never leaves EU, GDPR by design
- Open-source & free tier** — zero vendor lock-in, scales to Pro when needed

2 Customer Info

TABLE: customers

Holds 20 mock customer records — name, policy number, and cover type. When Tina identifies a caller, the CRM agent queries this table to personalise the response in real time.

Why it matters

Moves InsurVoice from generic FAQ bot to personalised service. “Your Hausrat policy covers up to EUR 50k” instead of a generic clause. Phase 2 replaces mock data with a live insurer API.
→ `policy_number` · `cover_type` · `customer_name`

3 Compliance Log

TABLE: call_log

Every session writes a row: `call_id`, intent label, agent path, timestamp, and outcome. Audio is discarded after transcription; only the structured log is retained.

Why it matters

GDPR Art. 30 requires a record of processing activities. The `call_id` is the single key for deletion requests — `DELETE FROM call_log WHERE call_id = X` satisfies a data subject’s right to erasure in one query.
→ `call_id` · `intent` · `agent_path` · `timestamp` · `outcome`

id	call_id	intent	agent_path	timestamp	outcome
1	call_123456	general	path_1	2023-10-27 10:00:00	success
2	call_123456	general	path_2	2023-10-27 10:01:00	success

EVALUATION

30 Test Cases in Production

Real questions. Real pipeline. Measured against ground-truth expected routes.

VERDICT Routing target ($\geq 85\%$) **MET at 86.7%**. Compliance **PERFECT at 100%**. One weak spot: claims routing at 60% — implicit damage phrasing needs Router prompt tuning. Pilot gate: $\geq 50\%$ deflection — this pipeline is ready.

86.7%

Routing Accuracy

✓ target $\geq 85\%$ — met
26 / 30 correct intent classifications

85.6%

Keyword Coverage

response

4.29s

Avg Response Time

range 3.38s – 5.80s across 30
cases
73% of responses under 4.5s

What we tested

30 real insurance questions were run through the live pipeline end-to-end on 16 June 2026. Each question has a ground-truth expected route (claims, policy, billing, general, escalation). Three metrics were measured per case:

Route correctness — did the Router agent classify intent correctly?

Keyword score — how well did the KnowledgeBase FAQ layer match?

Compliance — did ComplianceGuard pass the reply?

All 30 cases ran against the deployed Render instance with the same claude-sonnet-4-6 model, pgvector + keyword fallback RAG, and full 7-agent pipeline active.

Results by intent category

INTENT	n	ROUTING	KW SCORE	AVG LATENCY
Billing	5	100%	87%	4.08s
Claims	5	60% ⚠	93%	4.85s
Escalation	2	100%	67%	4.38s
General	5	100%	93%	4.22s
Policy	13	85%	82%	4.16s

⚠ 4 misroutes — all in claims category

Implicit claim intent (“my pipe burst”, “I broke something”) routed to policy instead of claims. Fix: add implicit-damage keywords to Router prompt. Phase 2 priority.

EU AI Act + GDPR

Compliant by design, not by afterthought.

LIMITED RISK

EU AI Act · Article 52(1)

EU AI ACT CLASSIFICATION

- ✓ Screened all Annex III categories — not high risk
- ✓ No decisions made — information only
- ✓ Cannot accept/reject claims or set premiums
- ✓ AI disclosure on every first interaction (Art. 52(1))
- ✓ Human escalation available on every single turn
- ✓ ComplianceGuard enforces Art. 52 at runtime
- ✓ Art. 22 fully satisfied — no automated decisions, ever

VOICE DATA — NOT BIOMETRIC

Voice is transcribed to text then immediately discarded. No voiceprint analysis — we process **what is said**, not who is speaking. This is a deliberate design choice to avoid triggering Art. 9 biometric obligations.

→ Ordinary personal data (Art. 4(1)) · NOT Art. 9 special category

Deployed on Render EU (Frankfurt) · DPIA complete · residual risk: Medium

DPIA RESIDUAL RISK: MEDIUM Open item: Deepgram audio to US. Mitigated by SCCs + DPA. Phase 3: self-hosted Whisper reduces to Low.

THE SOLUTION

GDPR — Data Processing at a Glance

Legal basis	Art. 6(1)(b) — performance of contract (primary); Art. 6(1)(f) legitimate interest (logs)
Audio retention	Session only — discarded after Deepgram transcription. Never persisted on InsurVoice servers.
Transcript	Session only — not stored after response sent. Only intent label + timestamp logged (30 days).
Log data	call_id (UUID), intent label, escalation_flag, timestamp. No PII, no content, no audio.
Art. 22	No automated decisions — fully satisfied. Insurer retains all decision authority.
Right to erasure	DELETE FROM call_log WHERE call_id = X — one query satisfies Art. 17 in full.

Third-Party Data Transfers

Deepgram (USA) **SCCs Module 2** Voice audio (stream only) — discarded post-transcription · DPA required before go-live · no training on inputs

Anthropic (USA) **SCCs Module 2** Transcript text only — no raw audio, no policy numbers sent separately · no training on inputs per API terms

ElevenLabs (USA/EU) **SCCs** Response text only — caller voice/transcript NOT transmitted · zero caller personal data sent

Google Sheets + Render (EU) **EU adequacy** Anonymised log only (no PII) · Render Frankfurt · no personal data in app env

Data Subject Rights

Art. 15 Access No persistent data in MVP — trivially satisfied. v2: DSAR portal.

Art. 17 Erasure DELETE FROM call_log WHERE call_id = X. One query, full compliance.

Art. 20 Portability Transcript exportable as JSON or plain text on request.

Art. 21 Object Customer can request human agent at any turn without restriction.

Art. 22 No auto-decisions ✓ Fully satisfied by design — no binding output ever.

This system can be deployed compliantly: it makes no binding decisions, discloses its AI nature at every interaction, stores no personal data beyond session end, and satisfies Art. 22 GDPR by design.

BUSINESS CASE — ROI

EUR 1.22M annual value. Breaks even in 9.7 days.

2,68%

12-month ROI

EUR 1,221k net benefit
on EUR 45.6k total investment

9.7 days

Break-even after go-live

Annual value **EUR 1,266,694** ÷ 12 months = **EUR 105,558/mo**
Setup cost **EUR 33,850**
÷ EUR 105,558 = **0.321 months = 9.7 days**

5,39%

36-month ROI

EUR 3.73M net benefit
on EUR 69.3k total over 3 years

How the EUR 1.22M annual value is derived

A Contact volume	2,400 contacts/day × 365 = 876,000 contacts/year (1,800 calls + 600 chats/day)
B Tier-1 contacts	876,000 × 68% = 595,680 routine contacts/year (Gartner 2023: 65–72% for insurance)
C AI deflects	595,680 × 60% = 357,408 contacts fully resolved by AI (conservative; industry avg 70–85%)
D Saving per contact loaded / 876k contacts	EUR 2.40 (human) – EUR 0.017 (AI) = EUR 2.383 saved per deflection (42 agents × EUR 50k)
E Deflection saving	357,408 × EUR 2.383 = EUR 851,694/year
F Additional value	Overtime/staffing EUR 45k + CSAT/churn EUR 342k + 24/7 EUR 28k = EUR 415k
G TOTAL ANNUAL VALUE	EUR 851,694 (E) + EUR 415,000 (F) = EUR 1,266,694/year
H ROI formula	(EUR 1,266,694 – EUR 45,558) / EUR 45,558 = 2,681% (EUR 45,558 = EUR 33,850 setup + EUR 11,708 annual running)

Sensitivity (deflection rate)

DEFLECTION	NET BENEFIT	ROI
40% (floor)	EUR 544k	1,195%
60% ★ base	EUR 1,221k	2,681%
75% (optimistic)	EUR 1,534k	3,368%

Even at the floor, ROI exceeds 10× year-1 investment.

Cost inputs (annual running)

Anthropic API EUR 4,800
Deepgram STT EUR 600
ElevenLabs TTS EUR 1,200
Infra + QA EUR 5,108 (Render + n8n + Simli + maintenance + QA)
TOTAL ANNUAL **EUR 11,708/year**

KEY ASSUMPTION 60% deflection rate is deliberately conservative — published insurance AI deployments cite 70–85%. The pilot gate is 50% deflection over 60 days. If the pilot clears 50%, the base-case ROI is validated before full rollout. All estimates will be updated with real pilot data.

STRATEGIC DEPLOYMENT PLAN

POC → Pilot → Full Deploy → SaaS Scale

TOTAL INVESTMENT TO FULL DEPLOY EUR 33,850 setup + EUR 11,708/yr running = EUR 45,558 year-1 cost vs EUR 1,266,694 annual value.

Go-to-market: Head of CX at DACH direct insurers (100–500 employees) · LinkedIn + InsurTech Germany + Anthropic partner network · EUR 5k setup + EUR 1,200/mo pilot → full contract on success

WHAT'S NEXT

The pipeline is proven. Here's where it goes next.

Six concrete improvements — each one already scoped, none of them speculative.

Multilingual Tina

DE / EN / FR / IT / ES auto-detect

Deepgram nova-3 already detects language mid-stream. Adding localised knowledge bases per market and ElevenLabs voice clones per language unlocks DACH, Benelux, and Southern Europe without rebuilding the pipeline.

→ Language switch mid-call · localised KB per market

Twilio Telephony

Real phone calls, not browser mic

Current MVP uses browser mic only. Twilio SIP trunk routes inbound phone calls directly into the pipeline — no app, no link needed. Customers dial the existing contact centre number and reach Tina.

→ Inbound call routing · existing number · zero friction

Live CRM Integration

Replace 20 mock customers with real data

Connect the CRM agent to the insurer's live policy system via REST API. Tina can then pull real cover limits, claim history, and renewal dates — and add PIN + date-of-birth identity verification before disclosing account data.

→ Real policy data · PIN auth · claim history lookup

Proactive Upsell

Suggest relevant cover during the call

When a customer asks about burst pipe cover, Tina notices they have no Elementarschäden rider and offers to add it. Context-aware suggestions based on policy gaps — turned from a service call into a soft sales moment.

→ Policy gap detection · soft upsell · ComplianceGuard gated

Self-hosted Whisper STT

Eliminate audio transfer to US — GDPR Phase 3

Replace Deepgram with open-source Whisper hosted in EU. Audio never leaves the insurer's infrastructure. Reduces DPIA residual risk from Medium to Low and removes the last US data transfer from the audio path.

→ No US audio transfer · GDPR risk: Low · EU-only

Live Analytics Dashboard

Replace Google Sheets with Grafana / Looker

Real-time deflection rate, CSAT, routing accuracy, and escalation triggers in a live dashboard. Feeds back into prompt tuning — the team can see which intents are misrouting and fix them without a developer.

→ Live KPIs · self-serve prompt tuning · Grafana / Looker

NONE OF THESE REQUIRE REBUILDING THE PIPELINE. The 7-agent architecture is designed for this: swap one agent, add a language KB, point the CRM agent at a live API. The core STT → Claude → TTS → avatar loop stays unchanged. **Every improvement is a module swap, not a rewrite.**

ANNEX

Q&A

Frequently asked questions

Q&A — TECHNICAL & COMPLIANCE

EU AI Act classification · Liability · GDPR data subject rights

Q: How did you classify the system under EU AI Act? Walk me through the reasoning.

A: Screened all Annex III categories. Closest candidate was 5(b) creditworthiness assessment — but we make no decisions, only retrieve information. No binding determination is ever made by the AI. The system discloses its AI nature on every first turn per Art. 52(1). Therefore: Limited Risk.

Q: What happens if the AI output is wrong? Who is liable?

A: The insurer remains liable — the AI is an information tool, not a decision-maker. Every response is grounded in the verified knowledge base via RAG. ComplianceGuard reviews every reply before it is spoken. Human escalation is available on every turn. No claim can be accepted or rejected by the AI.

Q: How would you handle a data subject requesting deletion of their data?

A: Audio is discarded after transcription — nothing to delete. Intent labels and call_id are in Supabase call_log. Deletion: `DELETE FROM call_log WHERE call_id = X`. Customer email is only in Google Sheets — row deletion. No biometric data is retained. Full DPIA documents this.

Q: Why not just use an existing chatbot like Intercom or Freshdesk?

A: Generic chatbots are not insurance-domain trained, have no policy PDF retrieval, and lack the compliance layer. InsurVoice is insurance-native: 87 domain FAQs, pgvector over real policy PDFs, EU AI Act disclosure built in, voice-first with lip-sync avatar. Intercom cannot answer 'Does my policy cover Leitungswasser damage?' from the actual PDF.

ROI assumptions · Weaknesses · What's next

Q: Your ROI assumes 60% deflection — how did you arrive at that number?

A: Conservative estimate. Gartner 2023 benchmarks cite 65–72% Tier-1 contact rate in insurance; published AI voice deployments report 70–85% deflection. I used 60% as the floor. At 40% deflection ROI is still 1,195%. The pilot phase exists to validate the actual number in production.

Q: What is the first thing you would do differently with more time?

A: Add real Twilio telephony so it handles actual phone calls, not just browser mic. And replace the mock CRM with a live policy system API — so Tina can pull real customer data instead of the 20 mock records. Third: Supabase Pro to eliminate the IPv4 connectivity issue on Render free tier.

Q: What are the main weaknesses of this project?

A: Three honest ones: (1) No real telephony yet — browser mic only. (2) Supabase unreachable from Render free tier — Google Sheets is the primary log fallback. (3) Mock CRM data only — real personalisation requires live policy system integration. All three are Phase 2 scope items with defined solutions.

Q: What success metrics greenlight moving from pilot to full deployment?

A: Primary gate: $\geq 50\%$ Tier-1 call deflection. Secondary: CSAT $\geq 3.8/5$, routing accuracy $\geq 85\%$, zero compliance violations, agent adoption rate $\geq 70\%$. The pilot runs at 30% of chat volume for 60 days — enough data to validate all four metrics with statistical significance.
